

Green Diamond Reward Scores: North American Small Cap ETFs

Background: With the explosive growth of Exchange-Traded-Products (ETPs), more firms than ever use ETPs to execute their trading and investment strategies. Research and analytics providers have historically coupled return and risk factors to achieve a holistic view of investment products.

We believe that a quantitative scoring system which independently gauges reward and risk provides more flexibility and precision in modeling ETPs.

Note: While it may be tempting to view the discussed methodology as stand-alone, it is certainly not. This paper demonstrates the value and potential Alpha within our quantitative model and more specifically, the ETFG Green Diamond Reward Ratings. Clearly, there exist many methods to apply these underlying ratings in creating various trading and investing strategies.

Summary: ETFG maintains two quantitative models to score ETPs for Reward and Risk respectively – these scores are generated daily by the ETFG Quant model.

- **ETFG Green Diamond Reward** ratings combine both Behavioral and Fundamental analysis to score equity-based ETPs that are not levered, inverse or have less than one year of history. All of the individual factor scores are weighted and combined to create a raw score. This raw score is then scaled from 1 to 10, with 10 being the highest (most reward) score and 1 being the lowest.

Methodology: As a quantitative-based firm, we are constantly analyzing the performance of our models in various ways over a multitude of timeframes. This paper reviews the strategy of creating a portfolio of ETFs that invest in Domestic Small Cap Equities. Specifically, two sets of portfolios are tested and compared to a buy and hold strategy of investing in iShares Russell 2000 ETF (IWM). Returns do not include transaction costs or borrow rates where applicable.

Long-Only Portfolios: Two long-only strategies (Long 6 and Long 3) are created by selecting the top scoring Small Cap ETFs as measured by their ETF Global® Green Diamond Score. Both portfolios are rebalanced and reconstituted on a monthly basis according to their month end Green Diamond Scores. The “Long 6” strategy selects the 6 highest scoring Small Cap ETPs, while the “Long 3” selects the 3 highest scoring Small Cap ETPs.

Market Neutral Portfolios: Two market neutral strategies (Neutral 6 and Neutral 3) are created by combining two sets of portfolios. The Neutral 6 combines the monthly returns of the “Long 6” portfolio with the returns of a “Short 6” portfolio. The “Short 6” is similar in construction to the “Long 6” except it shorts the 6 lowest scoring products as measured by their ETF Global Green Diamond Score. The Neutral 3 combines the monthly returns of the “Long 3” portfolio with the returns of a “Short 3” portfolio. The “Short 3” is similar in construction to the “Long 3” except it shorts the 6 lowest scoring products as measured by their ETF Global Green Diamond score.

Conclusion: A monthly rotation strategy that invests in the highest scoring Domestic Small Cap ETFs outperforms a buy and hold strategy on both an absolute return basis and a risk-adjusted return basis. A significant gain the Sharpe Ratio can be achieved by creating a market neutral strategy that takes long positions in the highest scoring products, while shorting the products with the lowest scores.

Sophisticated traders can use the net exposure to the underlying constituents of the products to create a pure equity market neutral strategy that may further enhance the return profile of the strategy.
